

Company Network Penetration Test

Mykyta Yeromenko

CMP210: Ethical Hacking 1

2023/24

Abstract

A penetration test, is one of the methods of providing digital security for a corporate network during which the tester uses the same methods that would be used by intruders, and therefore verifies the reliability and security of the network. This type of testing helps to identify vulnerabilities and potential entry points, which then allows for the development of effective measures to enhance security and minimize the risks of possible unauthorized access to corporate data and resources.

This report is focused on a detailed description of the methodology and process of performing a penetration test for the company's virtual corporate network, as well as the tools that were used during this process. While performing this project such key penetration testing steps as Network scanning, Vulnerability scanning, Enumeration, Password cracking, System hacking were considered and outlined.

The results of this report are the analysis of identified vulnerabilities and system misconfigurations, demonstration of potential malicious exploitation of vulnerabilities, as well as the description of countermeasures that can be applied to eliminate vulnerabilities and enhance network protection.

1 INTRODUCTION

1.1 BACKGROUND

Security is of paramount importance in a wide range of areas, from the personal sphere to the overarching stability of nations, and especially in an area as complex as information technology. In an era marked by globalisation and complex interconnectivity, the importance of security cannot be overemphasised, serving as a fundamental element in building trust, maintaining confidentiality and integrity of systems and data.

In the context of organisations where digitalisation has become ubiquitous, the importance of security becomes critical. Figure 1-1 presents statistics from gov.uk [1] on the use of digital services by businesses and charities for the year 2022. These statistics prove just how much businesses depend on digital services and the need for security of these services.

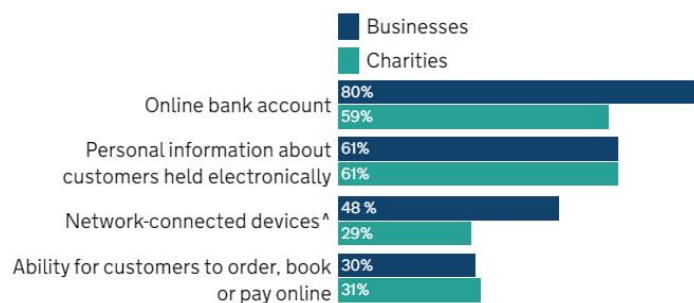

Figure 1-1 Percentage of businesses and charities that use digital services.

As organisations, from businesses and governments to individuals, increasingly rely on technology to manage, store and transmit sensitive information, there has been a corresponding increase in potential risks and vulnerabilities. Cyber threats are becoming more sophisticated and increasingly pose a greater risk to organisations. Figure 1-2 shows the estimated cost of loss to companies worldwide due to cybercrime [2], and this cost is increasing markedly every year.

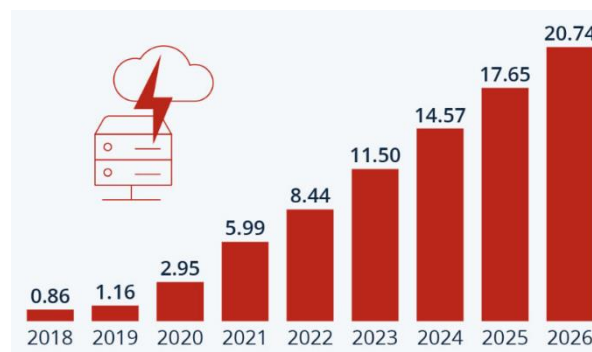

Figure 1-2 Estimated cost of cybercrime worldwide (in trillion U.S. dollars).

In this situation, proper and robust defences are essential, as the consequences of a successful cyber attack can be severe and far-reaching. In addition to financial losses, which can be significant, there is the potential for reputational damage that can take years to repair. Figure 1-3 shows that the percentage of companies that have experienced at least one successful cyberattack is gradually increasing each year [3]. This indicates that there are vulnerabilities and misconfigurations in the organisations network.

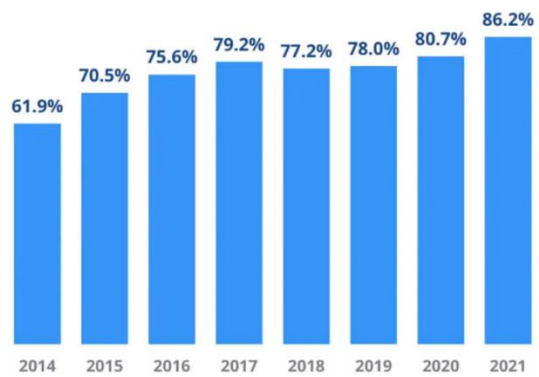

Figure 1-3 Percentage of organizations compromised by at least one successful attack.

Proper configuration of the corporate network is one of the key aspects of security for the entire organisation. Periodic checks of configuration settings and timely version updates of all network members provide a reliable and strong foundation on which to build further protection for the organisation.

The problem that this paper addresses is that of conducting security audits of a corporate network. After all, as can be seen in Figure 1-4 taken from HPE Security Research [4], the largest number of vulnerabilities are in misconfigurations, so this problem is quite important and critical.

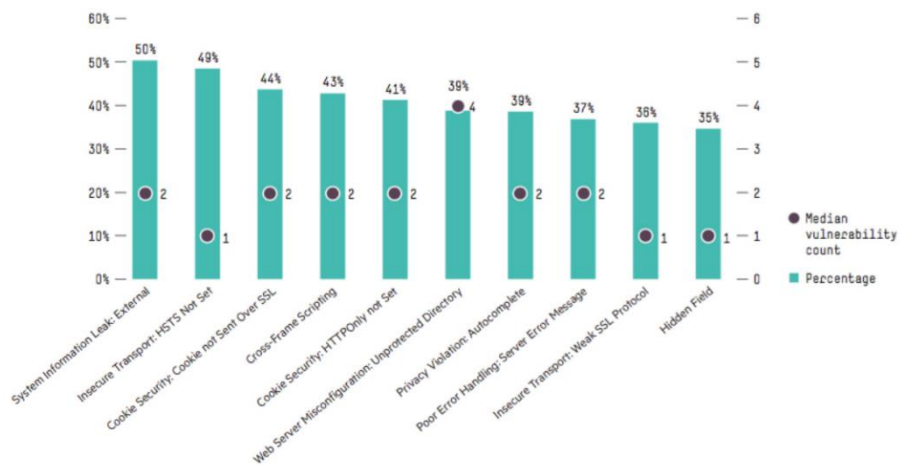

Figure 1-4 The most commonly occurring vulnerabilities.

1.2 Aim

The main objective of this project is to audit the security of a corporate network. However, this overall aim contains several sub aims:

- examine the provided corporate network
- detect for vulnerabilities and misconfigurations in the network
- utilise the gathered knowledge to demonstrate the hazard of present vulnerabilities
- determine ways to remediate vulnerabilities to prevent the possibility of their exploitation

2 PROCEDURE

2.1 OVERVIEW OF PROCEDURE

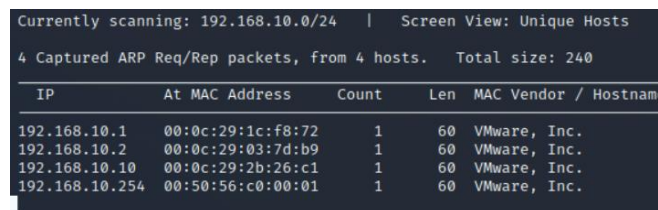

During the execution of this project, a penetration testing methodology called "grey box" was used. This methodology assumes that the tester has access to a single account internal to the network and minimum information of the architecture of the network under the test [5]. Based on the chosen methodology, the whole penetration testing process was divided into the following steps:

1. Network scanning
2. Vulnerability scanning
3. Enumeration
4. Password cracking
5. System hacking

This sequence of testing procedures is commonly employed in the realm of industrial penetration testing and facilitates an increase in the likelihood of success by utilising the information gained in the previous steps.

2.2 NETWORK SCANNING

The first phase of this project was to perform a scan of the target network. NetDiscover (version 0.9) [6] was the first tool that was used to obtain information about the hosts present in a given network range. As shown in Figure 2-1, 4 hosts were discovered.

Currently scanning: 192.168.10.0/24		Screen View: Unique Hosts	
4 Captured ARP Req/Rep packets, from 4 hosts.		Total size: 240	
IP	At MAC Address	Count	Len MAC Vendor / Hostname
192.168.10.1	00:0c:29:1c:f8:72	1	60 VMware, Inc.
192.168.10.2	00:0c:29:03:7d:b9	1	60 VMware, Inc.
192.168.10.10	00:0c:29:2b:26:c1	1	60 VMware, Inc.
192.168.10.254	00:50:56:c0:00:01	1	60 VMware, Inc.

Figure 2-1 Found hosts in the network range 192.168.10.0/24.

Based on the principles of the "grey box" methodology described earlier, the following information was retrieved:

- 192.168.10.1 and 192.168.10.2 are the ip addresses of the servers to be probed
- 192.168.10.10 - ip address of the provided account for access to the corporate network
- 192.168.10.254 - ip address of the tester's windows machine.

Such tools as Nmap (version 7.92) [7], Masscan (version 1.3.2) [8] and hping3 (version 3.0.0-alpha-2) [9] were used to perform a full, comprehensive and detailed scan. The most detailed and complete information was obtained using NMap. Masscan and hping3 outputs were used to compare with NMap outputs, but no additional information was recovered.

```
nmap -f -Pn -Pn -sS -sSU -sV -p 0-65535 -oN /home/kali/Desktop/FullScan_ServerX.txt 192.168.10.X
```

The full information obtained after port scanning for Server 1 and Server 2 is given in Appendix A and Appendix B, respectively.

Figure 2-2 The result of port scanning on server 1 and server 2.

As mentioned earlier, one of the aims of this paper is to examine a provided corporate network. Through the scanning phase, not only was the architecture of this network examined, but as can be seen in Figure 2-2, was discovered such important information as:

- the open ports
- the services running on these ports
- the versions for some of the services
- the domain used for the investigated corporate network is **uadcwnet.com**

The discovered information is basic and was used for the further stages of this work.

2.3 VULNERABILITY SCANNING

For the vulnerability scanning stage, popular scanners such as Nessus Essentials (version 10.3.0) [10] and OpenVAS (version 21.4.4) [11] were utilized. For Nessus Essentials, basic scanning was selected, but the following default settings were also modified:

- Discovery => Scan type: Port scan (all ports)
- Assessment => Scan type: Scan for known web vulnerabilities
- Credentials section settings are depicted in Figure 2-3.

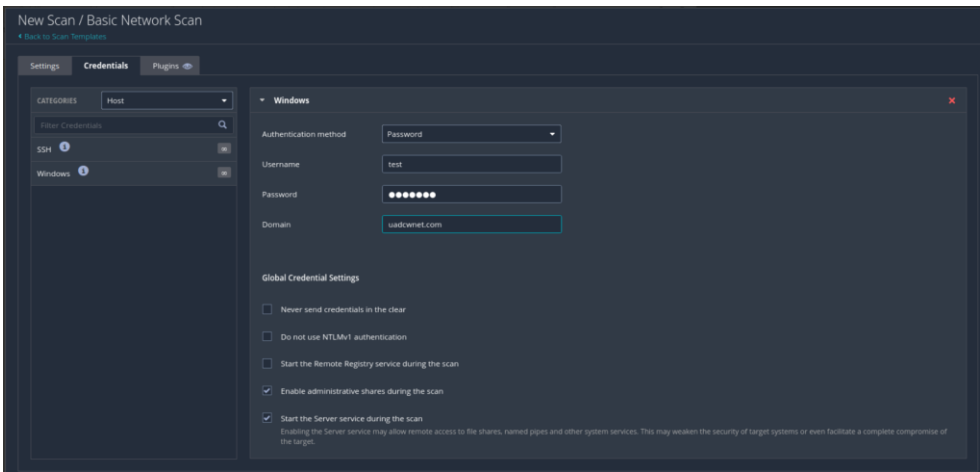

Figure 2-3 Credentials section configuration.

Nessus Essentials provided the most comprehensive and detailed list of identified vulnerabilities. As depicted in Figure 2-4, the scanning process revealed 28 vulnerabilities of varying degrees of severity for Server 1 and 24 vulnerabilities for Server 2. A complete list of the discovered vulnerabilities can be found in the Appendix C.

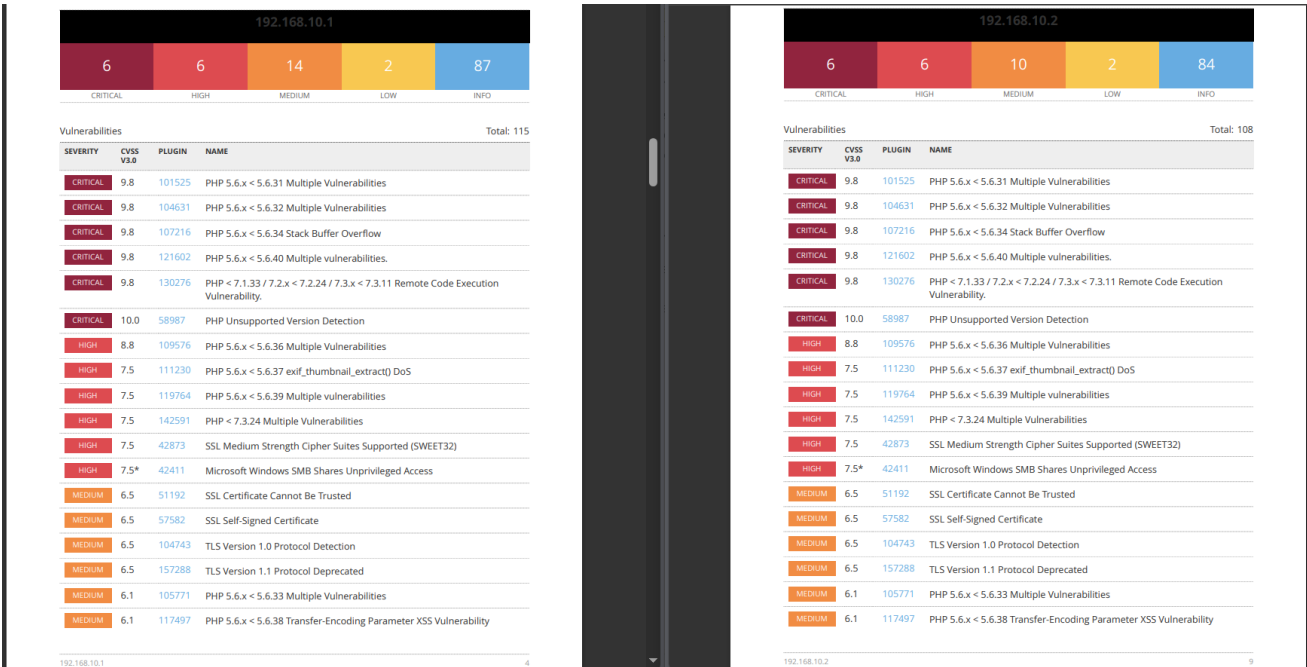

Figure 2-4 Vulnerability scanning results.

One of the goals of this work is to discover the vulnerabilities and misconfigurations present in the network. As can be seen in Figure 2-4, this step resulted in the discovery of a significant number of vulnerabilities on both servers, among which there are such crucial vulnerabilities as:

- outdated software versions
- misconfigurations
- absence of user input filtering

The vulnerabilities discovered were used in further phases of the work, to demonstrate the hazard of their presence.

2.4 ENUMERATION

The subsequent important stage was the Enumeration stage, which consists of collecting such information as:

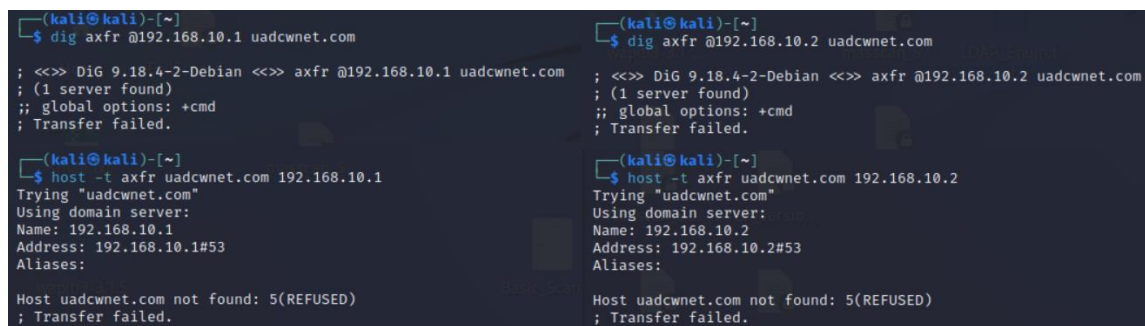

- list of user accounts of a given network
- list of user groups in existence
- company password policies
- available shares.

In order to perform a qualitative and comprehensive information gathering, the following enumeration techniques were applied:

1. DNS Enumeration
2. SNMP Enumeration
3. LDAP Enumeration
4. NetBIOS Enumeration
5. SMB Enumeration

2.4.1 DNS Enumeration

Two commands were executed to perform Enumeration with DNS Zone transfers, the “Dig” [12] command and the “Host” [13] command. However, during the test, it was discovered that there was no misconfiguration on this network, and as shown in Figure 2-5, it was not possible to use DNS Zone transfers on this network to perform Enumeration.

```

Aliases:
Host uadcwnet.com not found: 5(REFUSED)
; Transfer failed.
```

Figure 2-5 Inability to perform DNS Zone transfers.

2.4.2 SNMP Enumeration

During SNMP Enumeration, the basic settings were checked against the Read community string using the snmp-check v1.9 command-line tool [14]. As evidenced by the results shown in Figure 2-6, this network does not use default settings and therefore cannot be exposed to SNMP Enumeration.

```
(kali@kali)-[~]
$ snmp-check -c public 192.168.10.1

[+] Try to connect to 192.168.10.2:161 using SNMPv1 and community 'public'
[!] 192.168.10.2:161 SNMP request timeout
```

Figure 2-6 Result of running snmp-check command-line tool.

2.4.3 LDAP Enumeration

A tool called Ldapsearch (version 2.5.12) [15] was used for LDAP Enumeration. Using the command ***ldapsearch -x -H ldap://192.168.10.1 -D "Test account" -w test123 -b "dc=uadcwnet,dc=com"*** was obtained a comprehensive list of such valuable information as:

- a list of user account names
- a list of device account names from the network
- groups

Figure 2-7 Example of information collected using Ldapsearch.

As shown in Figure 2-7, some secondary information about employees was also collected, such as *streetAddress*, *name*, *department* and *mail*. The complete output obtained during this step is presented in Appendix D.

2.4.4 NetBIOS Enumeration

The NBTEnum program version 3.3 [16] was utilised to perform NetBIOS Enumeration. As a result, detailed information was obtained:

- Account Lockout Threshold
- Local Groups and Users
- Global Groups and Users
- Shares

Global Groups and Users	Cloneable Domain Controllers
	DnsUpdateProxy
	Domain Admins
	- Administrator
	- B.Yates
	- I.Robinson
	- J.Shaw
	- L.Washington
	- M.Padilla
	- W.Holt
	Domain Computers
	- CLIENT1\$
	- MSSQL1\$

Figure 2-8 Global Domain Admins

At the same time, as shown in Figure 2-8, important information such as Domain Admins was obtained. It is important to note that the accounts in Table 2-1 are important targets for attackers because they have more privileges than regular user accounts.

1.	Administrator
2.	B.Yates
3.	I.Robinson
4.	J.Shaw
5.	L.Washington
6.	M.Padilla
7.	W.Holt

Table 2-1 List of Domain Admins

The information obtained during the NetBIOS Enumeration stage was represented in Appendix E.

2.4.5 SMB Enumeration

To perform SMB enumeration, such popular tools as Rpcclient (version 4.16.3) [17] were utilised for a neatly compiled list of user accounts on a given network. A python script called Polenum (version 1.6) [18] was also used to retrieve password policy information.

However, the most comprehensive and inclusive set of information was obtained by using Enum4linux (version 0.9.1) [19]. Using the available credentials of the existing test account for the command **"enum4linux -a -u test -p test123 192.168.10.1"** such important information was obtained as:

- A table of user accounts with:
 - Account usernames
 - Employees' names
 - A short description
- Available shares
- Password policy
- Groups
- Domain Admins
- Domain Computers
- Domain Users

The information obtained during the SMB Enumeration was presented in Appendix F.

Figure 2-9 Critical information in the description

It is worth noting, as shown in Figure 2-9, in the table of user accounts in the "description" section, the password for the H. McLaughlin account was found. However, as was shown in Section 2.4.4 NetBIOS Enumeration, H. McLaughlin was not a Domain Admin and, therefore, was of no great interest. Nevertheless, this password was checked for reuse using in section 2.5.2 Password Spraying Attack.

To summarize the Enumeration phase, it can be stated that a substantial amount of critical information was gathered:

- Password policy
- Groups
- Domain Admins
- Domain Computers
- Domain Users
- Account Lockout Threshold
- Shares

This information proved instrumental in the subsequent phases, namely 2.5 Password Cracking and 2.6 System Hacking. The ability to collect such information underscores the presence of misconfigurations and vulnerabilities in the network.

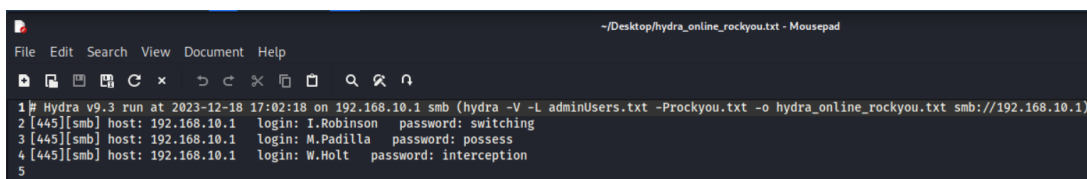

2.5 PASSWORD CRACKING

2.5.1 Brute Force

The first sub-phase of the 2.5 Password Cracking phase was brute force passwords. There was a wide range of different tools available for this task, however, the tool called Hydra [20] was chosen primarily due to its simplicity of utilization and the large amount of available material on how to operate the tool.

A seven-user list was created in order to perform the brute forcing. Global Domain Admins discovered in step 2.4.4 of NetBIOS Enumeration were added to the list. This choice was made in order to use resources and time most efficiently, as these accounts have the greatest privileges.

The first attempt to utilize a generic file of the potential passwords called small.txt failed, therefore the largest available list of passwords for brute force called rockyou.txt [21] was used.

```
1 # Hydra v9.3 run at 2023-12-18 17:02:18 on 192.168.10.1 smb (hydra -V -L adminUsers.txt -P rockyou.txt -o hydra_online_rockyou.txt smb://192.168.10.1)
2 [445][smb] host: 192.168.10.1 login: I.Robinson password: switching
3 [445][smb] host: 192.168.10.1 login: M.Padilla password: possess
4 [445][smb] host: 192.168.10.1 login: W.Holt password: interception
5
```

Figure 2-10 The result of Hydra

As shown in Figure 2-10, using the command ***“hydra -V -L adminUsers.txt -P “rockyou.txt” smb://192.168.10.1 -o hydra_online_rockyou.txt”*** three passwords were obtained for the administrator accounts as shown in Table 2-2.

Account	Password
I.Robinson	switching
M.Padilla	possess
W.Holt	interception

Table 2-2 Administrator passwords obtained by brute force

2.5.2 Password Spraying Attack

A shell script called DomainPasswordSpray.ps1 [22] was utilized to implement the Password Spraying Attack. The list of passwords tested for reuse was as follows:

- switching
- possess
- interception
- trainmen63
- test123
- uadcwnet2023

- uadcwnet2022
- uadcwnet!2023
- uadcwnet!2022
- uadcwnet23
- uadcwnet22

As can be noticed, the list consisted not only of already detected administrator passwords, but also included the password for the test account, as well as the password detected during the SMB Enumeration. In addition, it also included possible passwords based on the domain name and the current/previous year.

The outcome obtained by executing Password Spraying Attack can be seen in Figure 2-11.

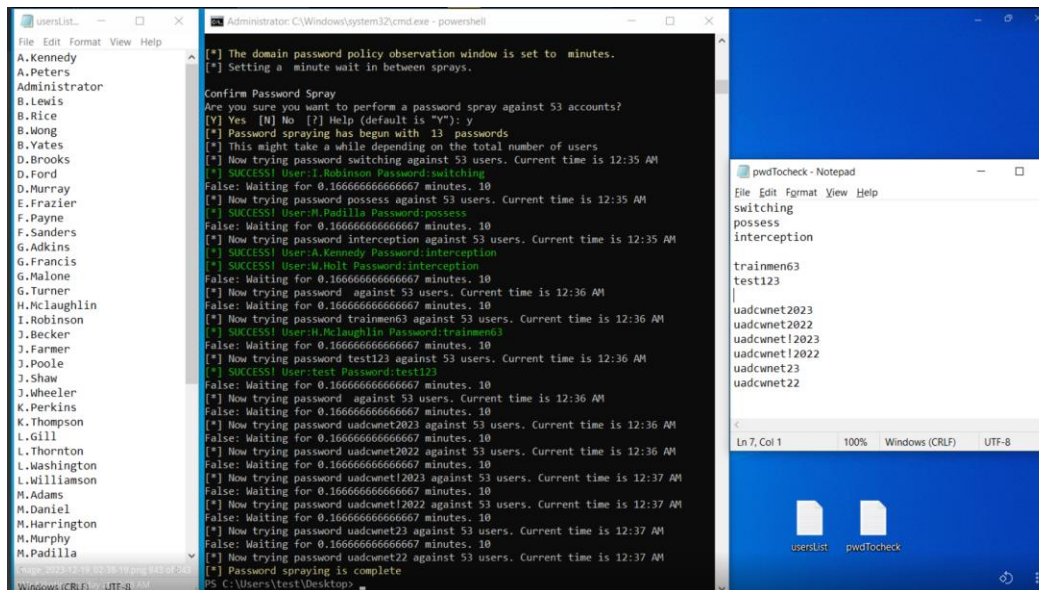

Figure 2-11 Result of Password Spraying Attack

The Password Spraying Attack revealed that the password 'interception,' which was used for W. Holt's administrator account, was simultaneously being used for A. Kennedy's regular employee account.

2.5.3 Hashes Cracking

The next stage involved utilizing the obtained administrator credentials to perform a hash dump. For this purpose, the msfconsole framework (version 6.2.7-dev) [23] was employed.

```

Figure 2-11 The process of hash dumping

As illustrated in Figure 2-11, utilizing the account information of W. Holt acquired during the 2.5.1 Brute Force stage granted access to the server, allowing for the extraction of all user password hashes. The complete list of obtained hashes is provided in Appendix G.

To crack the acquired hashes, several popular tools were employed, such as Cain [24], and NTLM rainbow tables 'mixalpha-numeric-space#1-7' [25]. However, the most successful and efficient tool turned out to be an online service called CrackStation [26]. The overall results after using all the aforementioned tools are presented in Table 2-3.

Table 2-3 The hashes that were successfully cracked

As observed in Table 2-3, at the conclusion of the hash cracking stage, 20 new passwords were obtained for various accounts, including one for the administrator account J.Shaw.

2.6 SYSTEM HACKING

2.6.1 Exploitation

For the exploitation stage of this project, two common hacking tools were used: msfconsole (version 6.2.7-dev) [23] and the exploit database searchsploit [27].

As it was discovered on the step 2.3 Vulnerability Scanning, both servers were reported to have a number of PHP related vulnerabilities, so it was considered a good idea to attempt to exploit this vulnerability.

The first task was to find a suitable exploit at Exploit-db [28]. Two of the most suitable options were selected:

- “PHP-FPM - Underflow Remote Code Execution (Metasploit)”
- “ThinkPHP - Multiple PHP Injection RCEs (Metasploit)”

All parameters were configured when executing both exploits, however, as shown in Figure 2-12 and Figure 2-13 neither exploit was successful.

```
msf6 > search php-fpm

msf6 exploit(wm/wakeup/thinkphp_rce) >
```

Figure 2-13 ThinkPHP - Multiple PHP Injection RCEs" execution failure

For this reason, a decision was made to search more specifically for and identify exploits for the other services running on the servers. The first appropriate exploit that was found was “Rejetto HTTP File Server (HFS) - Remote Command Execution (Metasploit)”. This exploit targets a service called HTTP File Server, which was running on the first and second servers on port 2025 and port 2033 respectively. As can be observed in Figure 2-14, Server 2 was remotely accessed using this exploit.

```
msf6 exploit(winx/http/laravel_token_serialize_exec) > search rejetto

Figure 2-14 successful execution of the "Rejetto (HFS) - Remote Command Execution" exploit

2.6.2 Post-exploitation

After remote access to the server was obtained, it was necessary to create a backdoor to ensure that if the exploited vulnerability was remediated by network administrators, remote access to the server could be obtained in the future.

A wide range of tools and techniques exist for creating backdoors. In this project, the backdoor was established by using a software called Shellter (version 7.2) [29].

As a first step, a 32-bit UniController.exe file was found on the server and then downloaded, due to the fact that Shellter can only generate payloads from 32-bit files. Then, using Shellter as shown in Figure 2-15, the Meterpreter_Reverse_TCP payload was inserted into the UniController.exe file.

```

```

Figure 2-15 Creating a payload for UniController.exe

The key step, as shown in Figure 2-16, was to stop the UniController.exe process on the Server 2 and by loading a file of the same name with the added payload, UniController.exe was spoofed. The last step was to remove the Application, System, and Security logs using the "**clearev**" command, which would make it more difficult to investigate if the attack was discovered.

meterpreter >

```

Figure 2-17 Process of connecting to the server via Meterpreter Reverse shell

As both servers were running Http File Server, remote access to the first server could be obtained in the same manner. Therefore, as mentioned in Section 1.2 Aim, one of the purposes of this research work was to demonstrate the dangers of the vulnerabilities present, which was accomplished in this phase of this work.

3 DISCUSSION

3.1 GENERAL DISCUSSION

During the course of this work, a significant number of critical vulnerabilities and misconfigurations were identified, which could potentially be exploited by malicious actors. Utilizing the discovered vulnerabilities, crucial information was obtained, including:

- Company domain
- Executable services on servers and their versions
- List of company user accounts
- List of company device accounts
- List of groups
- List of administrators
- Shares
- Employee names
- Employee email addresses
- Employee addresses
- Company password policy
- Password hashes and, ultimately, the passwords for some user accounts

It is important to note that personal information of users, discovered during the 2.4.3 LDAP Enumeration phase, such as names, email addresses, and addresses, could be exploited by malicious actors for social engineering. This poses a significant problem, as relying on the statistics presented in Figure 3-1 [30], 85% of system breaches occur due to social engineering.

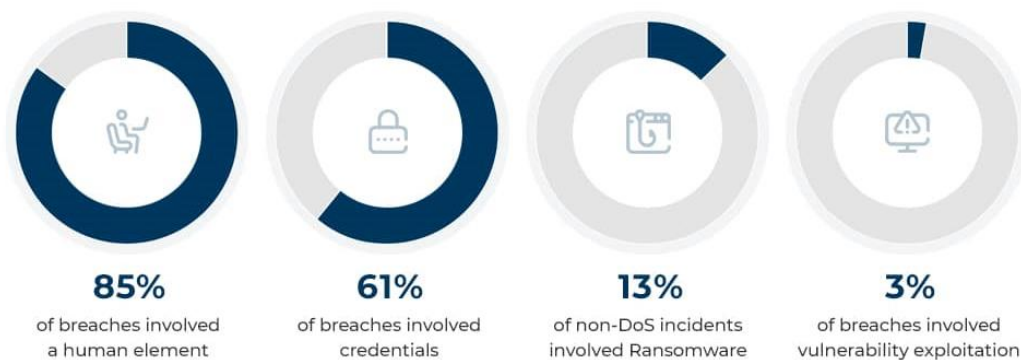

Figure 3-1 Statistics on the causes of security breaches and data breaches.

The use of passwords in an employee's Active Directory profile description is also considered poor practice, as it has the potential to provide malicious actors with a broad range of applications for the obtained credentials in subsequent stages of system compromise.

Referring to section 1.2 Aim, it can be observed that the first three objectives were successfully achieved:

1. The network was thoroughly investigated and enumerated.
2. The network was scanned, revealing numerous vulnerabilities and misconfigurations.
3. The identified vulnerabilities were successfully leveraged to gain access to certain user accounts and establish remote access to servers.

3.2 COUNTERMEASURES

During the system assessment, it was found that the system is protected against DNS Enumeration and SNMP Enumeration. However, the system was found to be vulnerable to LDAP Enumeration, NetBIOS Enumeration, and SMB Enumeration. Additionally, a number of vulnerabilities associated with outdated software were identified in the system. The majority of the detected issues can be addressed by taking the following steps:

1. **Access Controls:** Implement strict access controls to restrict unauthorized access to sensitive information. Ensure that only authorized personnel have access to directory services and network resources.
2. **Regular Audits and Monitoring:** Conduct regular security audits and actively monitor network activities to detect and respond promptly to any unusual or suspicious behaviour, including enumeration attempts.
3. **Firewall Configuration:** Configure firewalls to filter and control incoming and outgoing network traffic, especially on ports associated with LDAP, NetBIOS, and SMB, to minimize exposure and potential exploitation.
4. **Patch Management:** Keep systems and software up to date by promptly applying security patches. Regularly update and patch the operating systems and applications to address vulnerabilities that could be exploited during enumeration.
5. **Intrusion Detection and Prevention Systems (IDPS):** Deploy intrusion detection and prevention systems to actively monitor network traffic and detect patterns indicative of enumeration attempts, triggering immediate responses to mitigate potential threats.
6. **Network Segmentation:** Implement network segmentation to isolate critical assets and sensitive information, reducing the impact of enumeration attempts by confining attackers to specific network segments.
7. **Regular Security Assessments:** Conduct regular security assessments, including penetration testing and vulnerability assessments, to identify and address potential weaknesses in the network infrastructure before they can be exploited.

The listed measures constitute fundamental steps to ensure the protection of corporate networks, and they can significantly reduce potential risks for the company.

3.3 FUTURE WORK

Despite the extensive work conducted in analysing this network, there remains a substantial amount of work that can be undertaken. Several significant points that can be considered for future work include:

1. **Exploration of Shares:** Shares contain a significant and extensive volume of information that can be exploited in the system compromise phase. Accessible shares may contain .bat, .ps1, .vbs, .sql, and .txt files that potentially harbour hardcoded passwords, credentials, and other valuable information.
2. **Examination of All Running Services:** Examining all running services on both servers is a time-consuming process, but this meticulous examination can uncover new vulnerabilities that were not detected during the vulnerability scanning stage.
3. **Active Directory misconfigurations:** Since Kerberos was operational on both servers, an attempt to perform Kerberoasting could be made, and the servers could be scrutinized for any additional misconfigurations within the Active Directory.

The mentioned sub-stages were not addressed in this work due to limitations related to resources and the time allocated for the project. However, these sub-stages can be pursued as future work.

APPENDICES

APPENDIX A - PORT SCANNING RESULTS FOR SERVER 1

```
# Nmap 7.92 scan initiated Wed Nov 29 20:20:52 2023 as: nmap -f -Pn -sS -sU -sV -p 0-65535 -oN /home/kali/Desktop/FullScan_Server1.txt 192.168.10.1
Nmap scan report for 192.168.10.1
Host is up (0.00048s latency).
Not shown: 65501 closed tcp ports (reset), 63018 closed udp ports (port-unreach)
PORT      STATE    SERVICE      VERSION
21/tcp    open    ftp
22/tcp    open    ssh          OpenSSH for_Windows_8.6 (protocol 2.0)
25/tcp    open    smtp         ArGoSoft Freeware smtpd 1.8.2.9
53/tcp    open    domain       Simple DNS Plus
79/tcp    open    finger       ArGoSoft Mail fingerd
80/tcp    open    http         ArGoSoft Mail Server Freeware httpd 1.8.2.9
88/tcp    open    kerberos-sec Microsoft Windows Kerberos (server time: 2023-12-01 02:22:39Z)
90/tcp    open    http         Apache httpd (PHP 5.6.30)
110/tcp   open    pop3         ArGoSoft freeware pop3d 1.8.2.9
135/tcp   open    msrpc        Microsoft Windows RPC
139/tcp   open    netbios-ssn  Microsoft Windows netbios-ssn
389/tcp   open    ldap         Microsoft Windows Active Directory LDAP (Domain: uadcwnet.com0., Site: Default-First-Site-Name)
445/tcp   open    microsoft-ds Microsoft Windows Server 2008 R2 - 2012 microsoft-ds (workgroup: UADCWNET)
464/tcp   open    kpasswd5?
593/tcp   open    ncacn_http   Microsoft Windows RPC over HTTP 1.0
636/tcp   open    tcpwrapped
2025/tcp  open    http         HttpFileServer httpd 2.3
3268/tcp  open    ldap         Microsoft Windows Active Directory LDAP (Domain: uadcwnet.com0., Site: Default-First-Site-Name)
3269/tcp  open    tcpwrapped
3389/tcp  open    ms-wbt-server Microsoft Terminal Services
5985/tcp  open    http         Microsoft HTTPAPI httpd 2.0 (SSDP/UPnP)
9389/tcp  open    mc-nmf       .NET Message Framing
47001/tcp open    http         Microsoft HTTPAPI httpd 2.0 (SSDP/UPnP)
49664/tcp open    msrpc        Microsoft Windows RPC
49665/tcp open    msrpc        Microsoft Windows RPC
49666/tcp open    msrpc        Microsoft Windows RPC
49668/tcp open    msrpc        Microsoft Windows RPC
49669/tcp open    ncacn_http   Microsoft Windows RPC over HTTP 1.0
49670/tcp open    msrpc        Microsoft Windows RPC
49671/tcp open    msrpc        Microsoft Windows RPC
49674/tcp open    msrpc        Microsoft Windows RPC

APPENDIX C - NESSUS VULNERABILITY SCANNING RESULTS

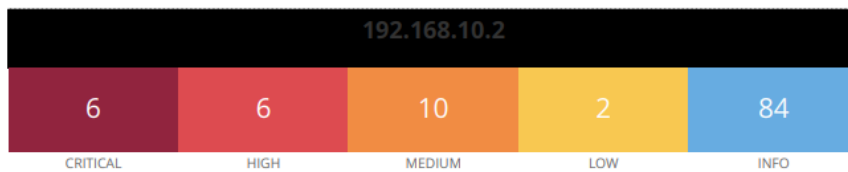

Vulnerabilities

Total: 115

SEVERITY	CVSS V3.0	PLUGIN	NAME
CRITICAL	9.8	101525	PHP 5.6.x < 5.6.31 Multiple Vulnerabilities
CRITICAL	9.8	104631	PHP 5.6.x < 5.6.32 Multiple Vulnerabilities
CRITICAL	9.8	107216	PHP 5.6.x < 5.6.34 Stack Buffer Overflow
CRITICAL	9.8	121602	PHP 5.6.x < 5.6.40 Multiple vulnerabilities.
CRITICAL	9.8	130276	PHP < 7.1.33 / 7.2.x < 7.2.24 / 7.3.x < 7.3.11 Remote Code Execution Vulnerability.
CRITICAL	10.0	58987	PHP Unsupported Version Detection
HIGH	8.8	109576	PHP 5.6.x < 5.6.36 Multiple Vulnerabilities
HIGH	7.5	111230	PHP 5.6.x < 5.6.37 exif_thumbnail_extract() DoS
HIGH	7.5	119764	PHP 5.6.x < 5.6.39 Multiple vulnerabilities
HIGH	7.5	142591	PHP < 7.3.24 Multiple Vulnerabilities
HIGH	7.5	42873	SSL Medium Strength Cipher Suites Supported (SWEET32)
HIGH	7.5*	42411	Microsoft Windows SMB Shares Unprivileged Access
MEDIUM	6.5	51192	SSL Certificate Cannot Be Trusted
MEDIUM	6.5	57582	SSL Self-Signed Certificate
MEDIUM	6.5	104743	TLS Version 1.0 Protocol Detection
MEDIUM	6.5	157288	TLS Version 1.1 Protocol Deprecated
MEDIUM	6.1	105771	PHP 5.6.x < 5.6.33 Multiple Vulnerabilities
MEDIUM	6.1	117497	PHP 5.6.x < 5.6.38 Transfer-Encoding Parameter XSS Vulnerability

MEDIUM	5.3	40984	Browsable Web Directories
MEDIUM	5.3	11213	HTTP TRACE / TRACK Methods Allowed
MEDIUM	5.3	152853	PHP < 7.3.28 Email Header Injection
MEDIUM	4.7	122591	PHP 5.6.x < 5.6.35 Security Bypass Vulnerability
MEDIUM	5.0*	11734	ArGoSoft Mail Server HTTP Daemon GET Request Saturation DoS
MEDIUM	5.0*	18140	ArGoSoft Mail Server Pro <= 1.8.7.6 Multiple Vulnerabilities (XSS, Traversal, Priv Esc)
MEDIUM	5.0*	10073	Finger Recursive Request Arbitrary Site Redirection
MEDIUM	4.3*	85582	Web Application Potentially Vulnerable to Clickjacking
LOW	3.3*	10663	DHCP Server Detection
LOW	2.6*	26194	Web Server Transmits Cleartext Credentials
